This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, azdiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF8073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at fitte.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 12 BP; 0 A; 0 C; 2 G; 10 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Local Similarity 83.3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 444

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at fire printed specification, but fire wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                         Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic discorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH0010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic formmat from WIPO at the printed specification, but the wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genemic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF0010-ABF9989, ABH0010-ABH99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABE99989 and ABI00010-ABE3073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but ftp.wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010 -ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; SEQ ID NO 375530; 29pp + Sequence Listing; German.

                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99899, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 data for this patent did not form part of the printed specification, but two obtained in electronic format from WIPO at they printed specification, but they wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                    Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·,

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC09989, ABC0010-ABE9989, ABE00010-ABE9989, ABE00010-ABE9989, and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but two will pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                              set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; SEQ ID NO 288936; 29pp + Sequence Listing; German.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF9989, ABF00010-ABF9989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at fitte.wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         40.0%; Score 8.8; DB 1; Length 12;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 12 BP; 0 A; 6 C; 0 G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The cligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic discorders. The coligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABE99989, ABH00010-ABE99989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at
                                                                                                                                                                                                                 SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                    Oligonucleotide primer SEQ ID NO 274506 for detecting SNP TSC0003574.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF32073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for derecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99899 and ABI00010-ABF80011 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                             Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                     Oligonucleotide primer SEQ ID NO 331032 for detecting SNP TSC0035932.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; SEQ ID NO 331032; 29pp + Sequence Listing; German.

New isolated X-linked inhibitor of apoptosis internal ribosome entry site, used to develop agents for treating, e.g. cancer.

Example IV; Fig 5A; 87pp; English.

The invention relates to the identification of modulators of capindependent translation and apoptosis. The method comprises exposing a crest compound to an X-linked inhibitor of apoptosis protein (XIAP) internal ribosome entry site (IRES) reporter cistron, and determining the amount of translation from the unexposed XIAP IRES compound relative to the translation from the unexposed XIAP IRES reporter cistron. A relative increase in translation from the exposed XIAP IRES reporter cistron indicates a compound that increases XIAP IRES compound relative increases in translation from the exposed XIAP IRES caperter cistron indicates a compound that increases XIAP IRES capendent (rap independent translation of the method construction of Advantances and caspase-7. Compounds identified by the method which decrease XIAP IRES dependent translation (thus leading to reduced expression of XIAP and hence increasing apoptosis) can be used for treating cancer. The methods can also be used for the identification of treating cancer. The methods can also be used for the identification of agents that upregulate XIAP translation and hence inhibit apoptosis, which can be used to treat autoimmune diseases, degenerative diseases or immunorejection. Such agents may, for example, be used to inhibit apoptosis of neurons in conditions such as Altheimer's disease; isleet capinal and better retinopathy; and cardiomycytes after myocardial conference which encode the survival of call or capan transplants. XIAP IRES elements can also be uncorporated into expression constructs which encode XIAP or other IAPP (Inhibitor of apoptosis proteins, e.g., TIAPP: AAYB1440). Such constructs may be used in

for gene therapy to inhibit apoptosis in a cell. The present sequence represents the RNA sequence of the wild-type human XIAP IRES polypyrimidine tract which, along with mutant polypyrimidine tracts (AAAA06947-A06954), was used in an exemplification of the present invention to determine whether the polypyrimidine tract is important XIAP IRES function 888888888

WPI; 2001-657177/75.

Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.

Claim 1; SEQ ID NO 275791; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABI82073 tepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010 -ABC99989, ABR00010-ABC99989, ABR00010-ABC99989, ABR00010-ABC99989, ABR00010-ABC99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fig. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, oardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 trepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genemic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and merabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF8073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire printed specification, but fire wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically prereated genomic DNA. This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form at From WIPO at

```

```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99889, ABH00010-ABH99889 and ABI00010-ABIS2073 trepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic from MIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABF00010-ABF9989 and ABI0010-ABI82073 trepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The cligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, axidovascular and metabolic disorders. The coingomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABI82073 trepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but two was obtained in electronic formmat from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC09989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073

The invention relates to characterising cell based toxins, where the cell possessing luminescent reporter molecules (biosensors) are provided on a mirrochip, and are treated with fluorescence based molecular reagents.

The cells are photographed with fluorescence optics, and the optical information is converted into digital data. The presence of the toxin in a reagent, is detected using the digital data. The presence of the toxin in closalisation, distribution structure of identifier, detector and closalisation, distribution structure of identifier, detector and closalisation storing a cell based toxin characterisation program, and a kit for cell based toxin detection. The method is used for characterising or detecting a biological cell based toxin that affect particular biological functions and for preparing molecular biochemical arrays for new drug discovery paradigm. It is also used in automated DNA sequencing, PCR application, positional cloning, hybridisation arrays and bioinformatics crising cell based quantity and speed molecular reagents, thereby crising cell based quantity and speed molecular reagents, thereby cresulting in increased quantity and speed of data collection, shortened cycle times and faster evaluation of promising drug candidates. The method also provides increased throughput while decreasing the volumes of cycle times and faster evaluation of promising drug candidates. The capacit and test compounds required in each assay. The biosensor comprises a signal component (fluorescent protein (fused e.g. NAP4, teager domain (localising the biosensor to a particular cellular cellular companies and the invention of a capacit of a protease recognition site (e.g. for a capacit ellular cellular cellular companies and the invention of a protease recognition site (e.g. for a capacit ellular cellular cellula

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The present invention relates to a method of diagnosing neurodegenerative diseases, comprising determining the concentration of a protein in a body sample, where the protein may be M30 or a variant thereof, M31, M32 or M33. The method is used to diagnose neurodegenerative diseases, particularly stroke but also e.g. fragile X syndrome, Huntington's, particularly stroke but also e.g. fragile X syndrome, Huntington's, particularly stroke but also e.g. fragile X syndrome, Huntington's, particularly acaneer. The proteins can be used to identify specific ligands, potentially useful for treating neurodegeneration, immune-system disorders (e.g. autoimmune diseases, allergy, viral infection, leukaemia, inflammation etc.), carcinoma and sarcoma. Inhibitors of the interaction between the proteins and the protein kinase IRAK-1 can be used to treat
                                                                                                                                                                             Diagnosis of neurodegenerative disease comprises detecting level of M30-
                                                                                                                                                                                                                                                                                                                                                                                                                                    neurodegeneration. The present sequence is a fragment of the M33 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ds; cell based toxin; luminescent reporter molecule; biosensor; microchip; drug discovery; MAP4; epitope; affinity tag; protease recognition site; caspase; target domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 12 BP; 1 A; 3 C; 2 G; 6 T; 0 U; 0 Other;

The invention relates to characterising cell based toxins, where the cell possessing luminescent reporter molecules (biosensors) are provided on a microchip, and are treated with fluorescence based molecular reagents.

The cells are photographed with fluorescence optics, and the optical information is converted into digital data. The presence of the toxin in a readent, is detected using the digital data. The presence of the toxin in classifier in each cell. Also included are a computer readable storage callsafier in each cell. Also included are a computer readable storage medium storing a cell based toxin characterisation program, and a kit for cell based toxin detecting bloogram) and a kit for cell based toxin detecting a biological coll based toxin that affect particular biological functions and for preparing molecular blochemical arrays for new drug discovery paradigm. It is also used in automated DNA sequencing, PCR application, positional cloning, hybridisation arrays and bioinformatics using cell based scanning and screening system. The method improves the target validation and candidate optimisation by combining many cell screening formats with fluorescence based molecular reagents, thereby resoluting in increased quantity and speed of data collection, shortened cycle times and faster evaluation of promising drug candidates. The method also provides increased throughput while decreasing the volumes of centenally ing it to microtubules) or detectable signal (epitope or affinity tage), a protease recognition site (e.g. for a caspase protein) and a test omparant fluorescent seasons to a particular cellular comparion of the biosensor to a particular cellular comparion.
                                                                                                                                                                                       Cell based toxin characterization method for e.g. in drug discovery paradigm, involves treating cells possessing luminescent reporter molecules with fluorescence based molecules reagents to detect presence of toxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0; Indels

or or Automated cell-based toxin detection, classification, and/or identification by treating cells involves use of three classes luminescent reporter molecules such as detectors, classifiers o

identifiers.

Example 10; Fig 29B; 214pp; English.

The invention describes methods of automated detection, classification and identification comprising treating cells containing luminescent reporter molecules (I) in array of locations with a test substance, where (I) are detectors, classifiers or identifiers, imaging cells in each coation to obtain luminescent signals and converting optical information into digital data to interpret presence of toxins in the test substance. The method are useful for detection of toxins in the test substance. Thosylating toxins, cytotoxic phospholipases, and exfoliative toxins. Thosylating toxins, cytotoxic phospholipases, and exfoliative toxins. The actors, classifiers and identifiers are described and serve as reporters of toxic threat agents. The first two levels of characterisation ensure a rapid readout of toxin class without characterisation characterisation whither a rapid readout of toxin class without secrificing the ability to detect many new mutant toxins or dissect several complex mixtures of known toxins. This sequence encodes a several complex mixtures of known toxins. This sequence encodes a process of the complex mixtures of known toxins. This sequence encodes a serveral complex mixtures of known toxins. This sequence encodes a serveral complex mixtures of known toxins.

The invention describes methods of automated detection, classification and identification comprising treating cells containing luminescent reporter molecules (i) in array of locations with a test substance, where (i) are detectors, classifiers or identifiers, imaging cells in each location to obtain luminescent signals and converting optical information into odigital data to interpret presence of toxins in the test substance. The method are useful for detection of toxins chosen from proteases, ADP-ribosylating toxins, cytotoxic phospholipases, and exfoliative toxins. Three classes of cell-based luminescent reporter molecules such as reporters of toxic threat agents. The first two levels of characterisation ensure a rapid readout of toxin class without sacrificing the ability to detect many new mutant toxins or dissect several complex mixtures of known toxins. This sequence encodes a protease biosensor recognition site used in the cell-based screening

The present sequence is that of DNA encoding the substrate recognition sequence (see AAY792) of procaspase-3. The DNA is used in a claimed recombinant nucleic acid encoding a protease biosensor. The nucleic acid (see AAZ7627-43) comprises: (1) a sequence (see AAAZ7661-76) encoding at least 1 detectable signal polypeptide; (2) a sequence (see AAAZ7577-611) that encodes at least 1 protease recognition afte, such as the present sequence, and (3) a sequence (see AAAZ7611-26) that encodes at least 1 reactant target sequence. An expression vector, a genetically engineered host cell and a recombinant protease biosensor are also claimed. A claimed method for identifying compounds that modify protease activity in protease biosensor with a test compound, and determining the procease biosensor distribution in the host cell, where changes in the distribution of the protease biosensor are correlated with modification of protease activity in a host cell include the recombinant nucleic activity by the test compound. Claimed kits for identifying compounds that modify protease activity in a host cell include the recombinant nucleic activity in a host cell in high content screens to detect in vivo activation of anymatic activity, and content screens to detect in vivo activation of a known recognition and identify specific activity based on cleavage of a known recognition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps
                                                                                                                                                                                  Recombinant nucleic acid encoding a protease biosensor useful for fluorescence based cell and molecular biochemical assays for drug discovery comprising three operably linked nucleic acid sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protease, biosensor, caspase-8, substrate recognition sequence, cell screening, assay, analysis, drug discovery, ss.

The present sequence is that of DNA encoding the substrate recognition sequence (see AAY79599) of procaspase-8. The DNA is used in a claimed recombinant nucleic acid encoding a procease biosensor. The nucleic acid (recombinant nucleic acid encoding a procease biosensor. The nucleic acid (see AAZ72627-43) comprises: (1) a sequence (see AAA27568-76) encoding at least 1 detectable signal polypebtide; (2) a sequence (see AAA27568-76) encoding at least 1 protease recognition site, such as the present sequence, and (3) a sequence (see AAA27611-26) that encodes at least 1 reactant target sequence. An expression vector, a genetically engineered nost cell and a recombinant protease biosensor are also claimed. A call involves contacting a host cell that possesses the recombinant protease biosensor with a test compound, and determining the protease acil involves contacting a host cell, where changes in the protease biosensor with a test compound, and determining the protease compounds that modify protease activity by the test compound. Claimed kits for identifying compounds that modify protease activity in a host cell include the recombinant nucleic acid, or the recombinant protease biosensor is useful in high contacts are protease biosensor is useful in high and contacting a protease biosensor is useful in high and contacting are protease biosensor or the protease biosensor or the protease biosensor or the protease biosensor of enzymatic activity, and activity has activity has activity by and activity has activity by and activity has activity by activation of enzymatic activity and activity by activation of enzymatic activity and activity by and activity by activation of enzymatic activity and activity by and activity by activation of enzymatic activity and activity by and activity by activation of enzymatic activity and activity by activation of enzymatic activity activation of enzymatic activity and activation of enzymatic activity activation of enzymatic activity activation of enzymatic activity and activity and activ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       activity based on cleavage of a known recognition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detection, classification, identification, toxin detection, protease, ADP-ribosylating toxin, cytotoxic phospholipase, exfoliative toxin, toxic threat agent; ds.

cregion of the cell. Once acted on by the protease of interest, the fluorescent protein is cleaved from the localisation sequence, and is free to migrate to other locations within the cell. The presence of a second localisation signal attached to the fluorescent protein enables the fluorescent protein to be directed to a different cellular compartment after cleavage of the protease recognition sequence. The change in distribution of the fluorescent protein can be detected using inaging methods with a high degree of spatial resolution. The methods and biosensors of the invention can be used to investigate a wide range of cellular activities and to screen compounds which modulate these activities. Biosensors containing a recognition site for caspase, for example, may be used for the screening of compounds which modulate compounds which modulates any be used for the extreming of compounds which modulates are compound optimisation by combining many cell screening formats with fluorescence-based molecular reagents and computer-based feature extraction, data analysis and automation, resulting in increased quantity and speed of data collection and faster evaluation of drug candidates. Sequences AAA93377-A93411 and AAA93440 represent protease recognition sites biosensor fusion proteins of the invention

Automated cell-based characterization of toxin by contacting cells containing luminescent reporter molecules with test substance and analyzing optically.

The invention relates to systems, methods and reagents for cell-based cord screening or detection of compounds which affect particular biological functions. The methods of the invention utilise fluorescent biodetector concentrations. The methods of the invention utilise fluorescent biodetector molecules which, when acted on by a compound of interest cause an alteration in the cellular distribution of at least the fluorescent concentrations are bloomed and the compound of interest the fluorescent protein (GFP), or derivatives thereof). Such biosensors are located in protein (GFP), or derivatives thereof). Such biosensors are located in the cellular biodetector fusion proteins camped to detect proteins are activity. Such proteins by the proteins a recognition signal which is acted upon by the proteins camped by the proteins and at least one cellular localisation signal. The latter two protease; and at least one cellular localisation signal. The latter two protease; or may be from where rologius sources. Due to the protease, or may be from where localisation signal, the biodetector protein is localised to a particular ceginate to other locations within the cell. The presence of a second localisation signal attached to the fluorescent protein is cleaved from the localisation sequence, and is free compartment after cleavage of the protease recognition of the according methods with a high degree of spatial resolution. The methods and biosensors of the invention of the fluorescent protein and be used to investigate a wide range of calmage in distribution of the fluorescent protein such as antimax activities and to screen compounds which modulate for example, may be used for the detection of proteolytic toxins (such as antimax may be used for the detection of proteolytic toxins (such as antimax and speed of data analysis and automation, resulting any ordinates of compound optimisation by combining many cell accompound optimisation by combining many cell accompound optimisation may be responsed by the many used as compo

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation cooden, coding reggion, 5' or 3' end ganomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genee encoding a polypeptide associated with lung and/or nasal airway dystunction and a second active agent comprising an entile lammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cust in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of tubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction,
                                                                                                                                                                                                                                                                                                                              ö
                              to ABA89972 represent ESR-alpha gene single nucleotide polymorphism (SNP) containing oligonucleotides, which are used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, antisense, lung dysfunction, nasal airway dysfunction, antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiinflammatory; notiallergic; antisathmatic; hypotensive; immunosuppressive; cytostatic; gene therapy, antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;
diseases. The human ESR-alpha gene is located on chromosome 6. ABA89869

The invention relates to systems, methods and reagents for cell-based screening or detection of compounds which affect particular biological functions. The methods of the invention utilise fluorescent biodetector molecules which, when acted on by a compound of interest, cause an alteration in the cellular distribution of at least the fluorescent molecy. In one embodiment, the biosensors comprise heat shock proteins (HSPS) fused to a fluorescent protein (e.g., jellyfish green fluorescent protein (GPP), or derivatives thereof. Such biosensors are located in the cytoplasm, but on stress activation translocate to the nucleus. In the cytoplasm, but on stress activation proteins comprise one or more fluorescent proteins; a recognition signal which is cleaved by the protease; and at least one cellular localisation signal. The latter two components may be components of a single protein which is acted upon by the protease, or may be from heterologous sources. Due to the localisation signal, the biodetector protein is localised to a particular
                                                                                                                                                                          ;

The present invention describes an isolated peptide (I) consisting of an amino acid sequence selected from: (a) the amino acid sequence of a variant of the oestrogen receptor alpha (ESPA-alpha) protein in AAG68251; or (b) a fragment comprising at least 10 contiguous amino acids of the protein in AAG68251. (I) has cytostatic, osteopathic, cardiant and vasorine cardivities, and can be used in gene therapy and vaccine production. (I) is useful for identifying an agent that binds to (I), by contacting (I) with an agent and assaying the contacted mixture to determine whether a complex is formed with the agent bound to the peptide. A polynuclectide (II), encoding [I), is useful in the development of diagnostics and therapies for diseases and disorders mediated/modulated by an oestrogen receptor (ER). (II) is also useful in gene therapy for treating cancer, osteoporosis and cardiovascular diseases. The human ESR-alpha gene is located on chromosome 6. ABA89869 to ABA89972 represent ESR-alpha gene single nucleotide polymorphism (SNP) Novel variant of estrogen receptor alpha polypeptide useful for determining the biological activity of a protein for high throughput screening and for raising antibodies that elicit an immune response in Human, oestrogen receptor alpha, ESR-alpha, ER; chromosome 6; Syne-2; synaptic nuclei expressed gene 2; haplotype; cytostatic; osteopathic; cardiant; vasotropic; gene therapy; vaccine; cancer; osteoporosis; cardiovascular disease; oestrogen receptor; SNP; single nucleotide polymorphism; ds. /standard_name= "single nucleotide polymorphism" ESR-alpha gene Liverpool clinical tissue sample SNP oligo #29. 0; Indels DB 1; Length 11; BP; 4 A; 4 C; 2 G; 1 T; 0 U; 0 Other; 4.4e+02; Winn-Deen ES; 40.9%; Score 9; DB 1 100.0%; Pred. The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (BAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; soseea, man, malanom, basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

                                                                                                                                                                                                                                                                                                 The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; inchthyosis, atopbic dermatitis, acne, seborarnea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                         In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential expression. (A) comprises protein or mRNAs or their fragments. (M1) is useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmaceutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                       Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ठ
                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesid, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with committee and cativity of target polypeptides associated with activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide creceptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially bulmonary obstruction and/or treat proteins and malignancy associated proteins and/or surfactant hypoproduction which are associated with a disease or conditions selected from pulmonary vasconstriction, inflammation, allergic susthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CP), allergic rhintis (AR), pulmonary conditions, and processed in the exemplification of read antisense oligonucleotides used in the exemplification of read antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                    Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers

```
The specification describes antisense oligonucleotides (AAX52869-X55271)
directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, gene initiation
codons, genemic flanking regions, intron-exch borders, the 5-end, the 3'
end and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX55180-271 can be used for the antisense treatment of
fiseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, respiratory
cute asthma, allergies, asthma, impeded respiration, respiratory
pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, menorestic cancer,
hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastasized
cother lungs, including breast and prostate cancer
New antisense oligonucleotides used in treatment of, e.g. pulmonary vasoconstriction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 11 BP; 0 A; 4 C; 2 G; 5 T; 0 U; 0 Other;

The present invention describes a new composition comprising an antisense oligomucleotide (OM) with low adenosine (Up to 15%), which targets nucleic acids involved in bronchoconstriction, allegies, and/or inflammation. The OM can have antiinflammatory, antiallegies, and/or antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating conficions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including the own procate cancer. The reduction of the adenosine content of the OMs reduces side effects. The A-containing OMs break down with the content content of the mach of the content of the mach of the content of the conten

nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA33323 to AAA3392) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 11 BP; 0 A; 4 C; 2 G; 5 T; 0 U; 0 Other;

The invention relates to haplotyping the protocadherin 2 (PCDH2) gene, comprising determining which of the haplotypes given in the specification defines one or both copies of the individual's pCDH2 gene. The polymorphisms are within a 30244 base pair sequence (ABA05413), fully defined in the specification. The polymorphic variants are useful in studying the expression and function of PCDH2, in expressing PCDH2 or protein for use in screening for candidate drugs to treat diseases such as cancer, related to PCDH2 activity, in studying the effect of the variation on the biological activity of PCDH2 and the binding affinity of candidate drugs targeting PCDH2. The haplotyping methods are useful in validating PCDH2 as a candidate target for treating a specific condition or disease predicted to be associated with PCDH2 activity or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with PCDH2 activity. The present sequence is that of a PCDH2 allele-specific oligonucleotide (ASO) PCR primer of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                New protocadherin 2 (PCDH2) polymorphic variants and encoding genes, useful in expressing PCDH2 protein for screening candidate drugs to treat diseases related to PCDH2 activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chemokine binding protein 2; CCBP2; CCBP2 protein isoform; gene therapy; polymorphic gene variant; single nucleotide polymorphism; human; primer;

The invention relates to an isolated polynucleotide comprising genes and haplotypes of the Chemokine binding protein 2 (CCBP2) gene. Polymorphic variants of the CCBP2 gene are useful in studying the expression and function of CCBP2, and in expressing CCBP2 proteins for use in screening candidate drugs for treating diseases associated with CCBP2 activity. Polynucleotides comprising a polymorphic gene variant or fragment may be used for therapeutic purposes, where a patient could benefit from expression or increased expression of a particular CCBP2 protein isoform, or an expression vector encoding the isoform may be administered to the patient Haplotype information is useful in improving the efficiency and output of several steps in drug discovery and development process, including target validation, identifying lead compounds, and early phase clinical trials. The polynucleotides of the invention can be used to treat disorders related to the CCBP2 gene by gene therapy. This polynucleotide sequence represents a preferred ASO primer for detecting CCBP2 gene polymorphisms relating to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmorary vasconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary discress syndrome; pain; cystic fibrosis; pulmonary disconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;

Human Th1 cell preferentially expressed gene SAGE tag, SEQ ID NO:134

(first entry)

29-NOV-2002

ABV78423;

activated T cell; T lymphocyte; immune response; expression pattern; preferential expression; immune disorder; ss.

SAGE tag; serial analysis of gene expression; human; Th1 cell;

```
Human, v-fos FBJ murine osteosarcoma viral oncogene homologue; FOS; PCR; cyrostatic; gene therapy; single nucleotide polymorphism; haplotyping; haplotype pair; developmental bone disorder; cancer; tumour; ss; primer; chromosome 14q1-q11.
                                                                                                                                                                                                                                                                                         Novel genetic variants of V-Fos FBJ Murine Osteosarcoma Viral Oncogene Homolog (FOS) isogenes, useful for improving efficiency and reliability in drug development for treating developmental bone disorders.
                                                          Human FOS gene allele-specific oligonucleotide PCR primer #19.

The invention relates to single nucleotide polymorphisms in the gene encoding the human v-fos FbJ murine osteosarcoma viral oncogene homologue (FOS) polyreptide. A method for haplotyping the FOS gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the FOS haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair in the anglotype or haplotype or haplotype or haplotype pair in a reference population, where a higher the haplotype frequency in the trait population indicates the trait is associated with the haplotype or haplotype pair. FOS and its corresponding DNA are used for studying the expression and function of FOS, for use in screening for candidate drugs to treat diseases related to FOS, for use in screening for candidate drugs to treat diseases related to FOS, for use also useful for studying the effect of variation on the biological activity of FOS as well as on the binding affinity of candidate drugs targeting FOS. Sequences ABR81377 represent alleles appearing objecting FOS. Sequences ABR81377 represent

The invention relates to SAGE (serial analysis of gene expression) tags and/or Th2 cells. The SAGE tags of this invention consist of a sequence of 10 mucleotides located donstream of the 5.-CATG-3' sequence motif lying nearest to the polyA region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in Th1 and/or Th2 cells, antibodies against these proteins, and inhibitors of the expression of groups of genes that are expressed in his and/or Th2 cell types. Groups of genes expressed in than and/or the two cell types may be used for the diagnosis and treatment of Th1 and Th2-related disorders. Sequences ABVR3850 are SAGE tags
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; PCDH2; protocadherin 2; haplotyping; polymorphic variant; SNP; single nucleotide polymorphism; cytostatic; cancer; chromosome 5q31; allele-specific oligonucleotide; ASO; PCR primer; ss.

ö
CSFIR isogenes in vivo, for in vivo screening and testing of drugs targeted against CSFIR protein, and for testing the efficacy of therapputic agents and compounds. Allele specific oligomucleotides (ASO) are useful as probes and primers, and for assaying a polymorphism in the target region. Without requiring any a priori knowledge of the phenotypic effect of any particular CSFIR or haplotype the invention provides a method for identifying lad compounds that are more likely to show efficacy in clinical trials. This sequence is a primer used to detect CSFIR gene polymorphisms by primer extension, described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acids involved in neuronal regeneration, useful in screening for modulators of regeneration or synaptic efficiency, and potential therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acids (ABL98957-ABL99004) involved in regenerative neuronal processes and encoded proteins (ABB79405-ABB79409) used to screen for compounds and potential therapeutic agents that modulate nerve cell regeneration and/or synaptic efficiency. They may also be used for treatment or diagnosis of defective or pathological memory and learning conditions. The present sequence is that of an isolated from serial analysis of gene expression (SAGE) experiments organizated from serial analysis of gene expression (SAGE) experiments versus a wildtype control. The resultant EST were used to isolate the nucleic acids of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mouse, neuronal, regeneration, nerve cell, synaptic efficiency, memory, learning disorder, serial analysis of gene expression, SAGE, gene expression, hippocampus, expressed sequence tag; EST; ss.

The present invention relates to a new polynucleotide comprising a nucleotide sequence which comprises lipase, hormone sensitive (LIPB) isogenes. The invention is useful in screening for drugs targeting LIPE isogenes that are useful for treating obseity and male sterility. The methods of the invention are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs or is useful in studying the expression and function of LIPE, and in expressing LIPE protein for use in screening for candidate drugs to treat discusses related to LIPE activity. It is also useful in studying the effect of the variation on the biological activity of LIPE as well as on the binding affinity of candidate drugs to great the binding affinity of candidate drugs targeting LIPE for the treatment of obseity and male sterility. The invention is useful for studying the expression of LIPE isogenes in vivo, for in vivo screening and testing of drugs targetical against LIPE protein, and for testing the efficacy of therapeutic agents and compounds for treating obseity and male sterility in a biological system. antifungal drugs comprising (a) contacting a test substance with a yeast call; and (b) monitoring expression of a NORF gene whose expression of varies as in Mi, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose contoring expression in the yeast cell of at least 1 NORF gene whose to study, monitor and affect phases of the call cycle, the differentially expressed genes may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF31268 to AAF41064 represent SAGE tags used in the exemplification of the present invention. S phase and G2/M; (2) a method (M2) for screening candidate method, in the exemplification of the present invention $\mathcal{G}_{\mathcal{G}} \mathcal{G}_{\mathcal{G}} \mathcal{G}$

Nucleotide polymorphisms in the human myeloproliferative leukemia virus oncogene (MPL) gene, useful for studying the function of and expressing MPL protein for use in screening drugs for treating diseases related to MPL activity.

Claim 17; Page 16; 85pp; English.

The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human myeloproliferative leukaemia virus oncogene (MPL) gene located on chromosome 1934, and methods for haplotyping and/or genotyping the MPL gene. The methods of the invention make use of allele-

The invention describes a novel isolated polynucleotide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for colony stimulating factor I receptor (CSPIR) gene, found on The colony stimulating factor I receptor (CSPIR) gene, found on The dolypeptide are useful for improving the discovery and development of malignant histocytosis, myeloid mainganencies, and inflammantory discorders and the haplotypes can be used to validate CSFIR activity, e.g. and the haplotypes can be used to validate CSFIR as a candidate target for treating a specific condition or disease predicted to be associated with CSFIR gene of an individual can also be used in developing disgnostic tests and therapeutic treatments. (I) is useful in studying the expression and function of CSFIR, and in creating the expression and function of CSFIR, and in creating the effect of treat diseases related to CSFIR and in studying the effect of the variation on the biological activity and in studying the effect of binding affinity of candidate drugs targeting CSFIR. Antibodies are useful in a variety of disanostic and prognostic formats and therapeutic methods. A transgenic animal is useful in studying expression of the ö perferning oligonaclectides for detecting MPL gene polymorphisms. The polymucleotides and screened compounds are useful for the treatment of diseases associated with MPL activity, such as congenital amegakaryocytic thrombocytopaenia (CAMT). AAS15570-AAS15607 represent primer-extension oligonucleotides for detecting human MPL gene polymorphisms Novel polymorphic variants of colony stimulating factor 1 receptor useful in studying expression and function of the protein, useful for screening candidate drugs to treat diseases e.g. inflammatory disorders. (transient receptor potential) family protein; (ii) is connected with etiology of BMS (Beckwith-Wiedemann syndrome) and/or (iii) is connected with tumors involving 11p15.5 abnormalities. The products of the match tumors involving 11p15.5 abnormalities. The products of the connected invention have anticaner and developmental activity. MRTI is involved in regulation of intracellular calcium in levels, which are essential for cequilation of intracellular calcium in longwith factors; also in apoptosis and cell growth, death and differentiation, and in urogenital diseases. Concluding polycystic kidney disease. (I) and related ribozymes, antisense RNA, proteins and antibodies (Ab) are used to treat or prevent diseases associated with altered expression of the MRTI gene or activity of its protein, or with calculum infilux into cells, e.g. BMS, Wilms tumor, rhabdoid tumors and thabdomyosarcoma. Probes from (I), or Ab, are also used for diagnosis of such diseases. (I) can also be used for recombinant thereby, as tissue or chromosomal markers, for identifying genetic diseases and related sequences, as primers for genetic fingerprinting, as competitive assays for (II), are used to raise Ab, as reagents in competitive assays for (II), as tissue markers; for identifying crothing and in screening for (ant) agonists. This sequence represents human MTRI gene intron9/exonl0 junction region described in the method of the invention

Polynucleotides comprising single nucleotide polymorphisms in the hum dopamine receptor D2, useful for detecting mutations associated with, e.g. schizophrenia, Parkinson's and myoclonus dystonia.

Disclosure, Page 24; 135pp; English.

(DRD2). The present invention describes polynucleotides comprising single nucleotide polymorphisms (SNPs) in the human dopamine receptor D2

The polynucleotides may be used in assays to detect and characterise polymorphisms in DRD2 that affect its expression and activity and are involved in disorders such as schizophrenia, Parkinson's and myoclonus dystonia (MD). This information would be useful for studying the biological function of DRD2 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression or function. Polymorphisms in the DRD2 gene affect the expression of active and functional polypeptides. Therefore it is advantageous to detect polymorphisms in the DRD2 gene and how those polymorphisms are combined in different copies of the gene. AAF7026 to AAF70308 represent human DRD2 allele specific oligonucleotide probes, and AAF70309 to AAF70304 represent human DRD2 allele specific oligonucleotide probes, to AAF70309 to AAF70405 allele specific oligonucleotide primers which are used in the detection of DRD2 polymorphisms. Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SACE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example, Page 329, 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, Polypeptides encoded by the transcripts are also useful in vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter immunotherapy
                                                                                                                                                                                                                                                                                                      ô

expression) tags used to identify mRNA transcripts encoding immunostiminatory cofactor proteins which are preferentially or immunostiminatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell complex) and subsequent recognition by T-cell receptors is alone activation of the cytotoxic immune response, particularly against tumour cells, immunostimulatory cofactors also being required for the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses.

They may be used in vaccines to induce an immune response, particularly against a tumour antigen, to modulate the genotype of an APC; to screen for against that modulate expression of differential cell differentially expressed genes. Detection of diseases related to abnormal expression of these dendritic cell differentially expressed genes, or of their encoded proteins, can be used in active immunotherapy (or to stimulate production of a containing them are used in active immunotherapy (or to stimulate production of a containing them are used in active immunotherapy (or to stimulate production of a containing them are used in active immunotherapy (or to stimulate antigen presentation of containing them are used in active immunotherapy (or to stimulate antigen presentation of containing containing them are used in active immunotherapy (or to stimulate antigen presentation of containing expectation of conta
                                                                                                                                                                                                                                   Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.

Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.

Claim 1; Page 116; 130pp; English.

expression) tags used to identify mRNA transcripts encoding captession) tags used to identify mRNA transcripts encoding captession) tags used to identify mRNA transcripts encoding cifferentially expressed in monocyte-derived dendritic cells compared differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs correspond to differentially expressed in dendritic cells, while preferentially or differentially expressed in dendritic cells, while cother transcripts correspond to novel genes. Antigen-presenting cell cother transcripts correspond to novel genes. Antigen-presenting cell cother transcripts correspond to novel genes. Antigen-presenting cell cother transcripts or expressed costimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells, immunostimulatory cofactors also being required for the tumour cells, immunostimulatory cofactors also being required for the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid against a tumour antigen; to modulate the genotype of an APC; to screen for against a tumour antigen; to modulate the genotype of an APC; to screen correspondent modulate expression of differentially expressed genes in an APC; and as hybridisation probes (amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially

for enhancing the prophylactic or therapeutic respiratory effect of an autinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Pharmaceutical composition for treating ailments associated with impaired ö respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid

Disclosure; SEQ ID NO 11693; 872pp; English.

ubiquinone

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention immunosuppressive, and cytostatic activity. The composition app have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also AB2296451 ID AB232 ARX AB23 XX AB23 XX AB23 XX AB23 XX AB23 XW AB101 XW AB101 XW AB101 XW AB20 YW AB

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense cligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activity of target polypeptides associated with lung/respiratory disorders and transmitters, transcription factors, immunoglobulins and antibodies, and transmitters, cytokines and chemokine receptors, adenosine receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system petide transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The creeptors, binding proteins and malignancy associated proteins. The antipulatory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or

Disclosure; SEQ ID NO 12396; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genemic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nastal alraway dysfunction and a second active agent comprising an antiinflammatory steroid and ubsquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and immunosuppressive, and extocratic activity. The composition may have a use in antisense gene thrappy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also

The present invention describes a new composition comprising an antisense oligomucleotide (ON) with low adenosine (up to 15%), which targets cutcled acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergid, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, cuseful for the treatment of diseases and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c.g. impaired airways, including lung diseases ond diseases whose secondary impeded respiration, respiratory distress syndrome, pain, cystic impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the consension of the adenosine state of deoxyadenosine which activates adenosine receptors causing concluded esquences given in the sequence listing from the present cinvention, which correspond to SEQ ID NO:1 to 1815, but the sequences differ cinvention, which correspond to SEQ ID NO:1 to 1815, but the sequences of from the previously named sequences. SEQ ID NO:1 to 1816, AAA3333 to AAA33922 are specifically claimed ONs from the present invention. N B. Sequences given in the disclosure of the present invention. Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.

Claim 14; Page 623; 1592pp; English.

The present invention describes low adenosine (A) content antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (C) can have respiratory, bronchoditator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. (The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with cativity of target polypeptides associated with cativiting peptide factors and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, indiving proteins, adenosine receptors, brinding proteins, adenosine receptors, brinding proteins and malignancy associated proteins. The receptors, canding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including proteins and malignancy associated proteins. The and/or bronchoconstriction and/or lung inflammation, allergy olices and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstratorion, inflammation, allergic fibrosis (CF), allergic rhinitis (AR), pulmonary transplantation rejection, pulmonary disease (CPD), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary transplantation rejection, pulmonary under and/or ancer. AAR/18434 to AAR/21543 represent human polymucleotide invention of the exemplification of the exemplification of the exemplification of the proper of the exemplification of the exemplification of the exempletices. the present invention

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors. WPI; 1999-591315/50.

Coeshott C, Mcswiggen JA;

Claim 56; Page 136; 305pp; English.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl bydrocarbon nuclear transporter (ARNY) gene, an integrin subunit bete 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA1762 to AAA19154 represent their recresponding target sequences; and AAA19155 to AAA19152 represent their corresponding target sequences; and AAA19155 to AAA1922 represent their corresponding target sequences; AAA19223 to AAA1922 represent their corresponding target sequences; AAA21689 to AAA21689 represent their corresponding target sequences; AAA21689 to AAA21689 represent their corresponding target sequences; AAA21689 to AAA21687 and AAA21635 to AAA21635 to AAA21633 represent their corresponding target sequences; AAA21689 to AAA21687 and AAA22476 to AAA23262, AAA23343 to Cfor integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to the invention are used for modulating the sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit belas, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARND), inflammation, and arthritis, as well as macular degeneration (ARND), inflammation, and arthritis, as well as macular degeneration (ARND), inflammation, soler-Weber-Rendu syndrome, syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, cynthem syndrome, whymit alpha-6, or recent the levels of AAA214 the l integrin subunit alpha-6, or integrin subunit beta-3

New antisense oligonucleotides used in treatment of, e.g. pulmonary vasoconstriction.

Disclosure; Page 73; 120pp; English.

The specification describes antisense oligomucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions associated with one or more diseases,
conditions or mixtures. The artisense oligomucleotides may be derived
cronditions or mixtures. The artisense oligomucleotides may be derived
from sequences AAX55272-74. These multiple target oligomucleotides
conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, allergic rhinitis,
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
acute asthma, allergies, asthma, impeded respiration, respiratory
disease (COPD), and cancers such as leukemias, lymphomasy carcinomas e.g.
colon cancer, breast cancer, lung cancer, pancreatic cancer,
colon cancer, breast cancer, lung cancer, pancreatic cancer,
chepatocellular carcinoma, kidney cancer, melanoma, hepatic metastasized
colon cancer, breast cancer, under cancer, melanoma, hepatic metastasized
colon cancer, breast cancer, melanoma, hepatic metastasized
colon cancer, breast and prostate cancer

The present invention describes a composition (I) suitable for administration in a mammal, which comprises a modified oligonucleotide (II) of 7-7s nucleotides contraining 7 or more contiguous ribose groups linked by achiral 5-3' internucleoside phosphate linkages, where the modified oligonucleotide is complementary to a region of a gene associated with a pathological disorder. Also described: (I) a nutritional supplement comprising (II); and (2) a cosmetic composition comprising (II), where the modified oligonucleotide is complementary to a region of a gene associated with a skin disorder. (I) and (II) can have comprising (II), where the modified oligonucleotide is complementary to a region of a gene associated with a skin disorder. (I) and (II) can have tranquilliser, antilinflammatory, antiuncer, laxative, antimigraine, conversing tranquilliser, antilinflammatory, antiuncer, laxative, antimigraine, conversing a patient with a conversion of a gene associated with a stone store for treating a patient with a pathological disorder selected from abnormal appetite, hypertension, on pathological disorder selected from abnormal appetite, hypertension, anxiety, stress, inflammatory bowel syndrome, ulcerative collisis, crohn's disease, and proposite stores, and stones, gall stones, constipation, colds, chronic pain, pre-menstrual syndrome, trauma, carpal tunnel syndrome, convenient fatigue syndrome, rosacea, arthritis, poriasis, prostatis, prostatis, chronic pain, pre-menstrual syndrome, trauma, carpal tunnel syndrome, chronic fatigue syndrome, rosacea, arthritis, positis, prostatis, constitient of supplementing the diet of an individual supplementing the diet of an individual with a skin disorder. The antisense oligonucleotides are useful in the treatment of tumours in which expression of TGF-beta is of relevance for pathogenicity and/or inhibition of pathological angiogenesis. They are used especially for the treatment of the immunosuppressive effect of TGF-beta, augmentation of the proliferation of cytocixic lymphocytes, treatment of endogenous hyperexpression of TGF-beta, treatment of breast tumours, neurofibromas and malignant gliomas, including glioblastomas, treatment and prophylaxis of skin cardinogenesis, and treatment of oscophageal and gastrio. AAQ78352-Q78488 The sequences given in GENEEEO files AAQ78352-Q78488 are antisense oligodeoxymucleotides of TGF-beta 1. The sequences given in GENEEEO files oligodeoxymucleotides of TGF-oligodeoxymucleotides of TGF-beta 2 in the form of physhorothioate analogues. The invention describes a recombinant influenza virus (I), stable in the absence of any helper virus, that has a viral RNA segment being a biscistronic RNA molecule coding for two genes in tandem arrangement (tandem RNA segment, TRS). (I) is useful for expression of incorporated foreign gene(s) and RNA molecules in cells. (I), preferably a recombinant influenza A virus is useful for: preventing and/or treating influenza, and for preparing a medicament for vaccination purposes; somatic gene therapy, and as immunogen for inducing antibodies; as an expression vector for producing proteins or glycoproteins; preparing agents for somatic gene therapy; immunotherapy, preferably autologous immunotherapy; transfer and expression of foreign genes and RNA molecules into cells infected by such viruses, where the RNA molecules to be expressed include antisense or double-stranded sequences relative to the target cell cellular mRNA molecules, and/or the agent is suitable for sequence sequence represents a 3 conserved region mutant of influenza C virus the mathy of the mathy influenza C construct, described in

The method is used for expressing TAA or VAA in dendritic cells. The cells are used for preparing a medicament for treating tumours or viral infections. A vaccine can be created by using dendritic cells presenting tumour antigens to induce an immune response. This polynucleotide sequence represents an RNA region of a modified influenza C virus of the invention
                                                                                                                                                                                                                                                                                                            Expressing tumor or viral associated antigens by dendritic cells, used for treating tumors or viral infections, comprises using recombinant influenza virus containing nucleic acid encoding the antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Influenza virus; transcription; replication; RNA polymerase; vaccine; gene therapy; cytostatic; anti-HIV; hepatotropic; antiinflammatory; immunomodulator; virucide; infectious disease; ss.

```
The present invention describes a human influenza virus (I) comprising an CRNA-sequence encoding a modified RNN-polymerase that differs from the wild-type RNA-polymerase of the human influenza virus in that at least 1 of the human influenza virus from FVV Bratislava RNA-polymerase of the human influenza virus from FVV Bratislava RNA-polymerase of the human influenza virus from FVV Bratislava RNA-polymerase of the human influenza virus from FVV Bratislava RNA-polymerase of the budden with the corresponding amino acid residue(s) as present in FVV Bratislava RNA-polymerase. (I) has virucide, cytostatic, anti-HIV, competenced in gene therapy and vaccines. The influenza virus is useful for used in gene therapy and vaccines. The influenza virus is useful for preparing agents for: (a) gene transfer into cells, preferably into commanalian cells, particularly into human cells, by viral infection; (b) gene transfer into antigen-presenting cells, and the use of the obtained commanalian cells, ravivo mammalian cells, and the use of the obtained contained in memune response, including the induction of a T-cell contained in immunotherapy, in vivo somatic on infections disease; (c) transfer and expression of foreign genes into cells infected by such viruses; or contained preferably for autologous immunotherapy; (f) transfer and expression of RNA molecules into cells infected by such viruses, preferably the RNA molecules to the target cellular mRNA molecules, and complease, and of the agent is suitable for sequence specific gene collections, and vor the agent is suitable for sequence specific gene collections, and vor the agent is suitable for sequence specific gene collections, and vor the agent is suitable for sequence specific gene collections, and vor the agent is suitable for sequence specific gene collections, and vor the agent is suitable for sequence specific gene collections agained HIV, hepatists of viruses can be influenza virus general structure related oligonuclectide, given in the completion of the present invent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                      New human influenza virus comprising an RNA-sequence encoding a modified RNA-polymerase, useful for preparing agents for therapeutic and prophylactic vaccination, or treating a growing tumor or a chronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Influenza C; tandem RNA segment; TRS; gene expression; influenza; vaccine; somatic gene therapy; expression vector; immunotherapy; autologous immunotherapy; gene silencing; ss; mutant.

```
The present sequence is an oligonucleotide which was used to demonstrate the invention. The invention concerns end-blocked acid resistant oligonucleotides which are also resistant to nuclease degradation and are capable of binding specifically in an antisense manner. This means that they are useful in the treatment and prevention of infections, inflammatory diseases and cancer, as well as having non-therapoutic applications in cosmetics, for example in skin tanning products. In addition, they can be used in antibacterial applications such as sterilisation of surgical instruments, and in antibacterial lotions and soaps. A number of different versions of this sequence were produced, including an unblocked 2'-O-methyl RNA, a 2'-O-methyl RNA with 3' and 5' buttanol blocked ends, a 3'-O-methyl phosphodiseter; a 2'-O-propargyl and a 2'-O-methyl phosphodiseter. These were all used to show that the modified sequence is less susceptible to degradation than the natural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modified nucleic acid polymer used for treating inflammation, cancer, bacterial, viral and fungal infections and in disinfectants has a blocking chemical modification at the end of the polymer.
                                                                                                                     End-blocked acid-resistant oligonucleotide; infection; inflammatory disease; cancer; antibacterial application; phosphorothicate linkage; primer; ss.
                                                                                   Modified end-blocked acid-resistant oligonucleotide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 14 BP; 4 A; 3 C; 5 G; 2 T; 0 U; 0 Other;

The present sequence represents an antisense oligonuclectide, directed against the phosphodiesterase 4D (PDE4D) gene. The oligonuclectide is used to construct the polymer of the invention. The specification describes an acid resistant polymer which is complementary to PDE4, and comprises a nucleic acid with a backbone structure that is modified from that of a naturally occurring nuclectide polymer and a blocking chemical modification at or near one end of the nucleic acid. The acid resistant polymer is characterized by a pH stability of an hour at pH 0.01 to 10 and a nuclease resistance of twice that of naturally occurring nucleic acids which have the same number of nucleotides. The polymers are used to inhibit the expression of genes encoding PDE4. They are useful as analytical tools in the study of individual PDE isoforms and can treat analytical tools in the study of individual PDE isoforms and can treat expression, thrombosis, cystic fibrosis, gastric lesions, pulmonary hypertension, glaucoma, multiple solerosis, atopic dermatitis, asthma, and other allegic disorders. Other illnesses in which as increase of the control of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cyclic AMP or decrease in phosphodiesterase levels is useful, can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New acid resistant polymer complementary to phosphodiesterase 4 for treating depression, thrombosis, cystic fibrosis, gastric lesions, pulmonary hypertension, glaucoma, multiple sclerosis, atopic dermatitis

The present invention describes low adenosine (A) content antisense coligonucleotides and compositions (1) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (C. (I) can have respiratory, pronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.

C. immunosupressive, antiasthmatic, hypotensive and cytostatic activities.

C. immunosupressive, antiasthmatic, hypotensive and cytostatic activities.

C. immunosional controlled and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with a crimunosiobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, chemokine receptors, adenosine receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central creceptors, binding proteins and molecules and non-nervous system peptide creceptors, binding proteins, agrewth factors, vasocative peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy (les) and/or constriction and and a disease or consistion and and a disease or consistion and and a disease or consistion and an antise of the minimum and an and a disease or consistion and an and a disease or consistion and and an antise and and an antise and and an antise and and an antise and and an an
                                                                                                                                                                                                                                                                                                                                         Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis,

Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.

Claim 14; Page 209; 1592pp; English.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the cytostesion and or activity of target polypeptides associated with lung/respiratory disorders and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, committers, anderson molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, brinding proteins adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system petities and peripheral nervous and non-nervous system cerptors, defensins, growth factors, vasocative peptides and circlestors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders conditions selected from pulmonary obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(iss) and/or surfact ant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergy (RDS), pain, cystic fibrosis (CF), allergic whinding respiratory disease (CDP), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or enacer. APF18434 to AAF21543 represent human polynucleotide fra present invention the present

The present invention describes low adenosine (A) content antisense oligonuclectides and compositions (I) comprising them. In the antisense cligonuclectides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiathmatic, hypotensive and cytostatic activities. The antisense oligonuclectides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with ung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoslobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, chemokines endogenously produced specific and non-specific enzymes, chemokine receptors, adenosine receptors, brinding proteins, adenosine receptors, practice and non-nervous system (CNS) and peripheral nervous and non-nervous system petide actors and malignancy associated proteins. The creeptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, and/or lung inflammation, altergas syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary disease (CDD), when any transplantation respiration, respiratory disease (CDD), when any analyty and any promobilis, and any promobilis, and any promobilis, and any promobilis, and any promobilis. adenosine receptors during metabolism, useful e.g. for treating cancers and/or cancer. New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or cancers.

Disclosure; Page 483; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects affilict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, AAA34070/0/

impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the constructions side effects. The A-containing ONB break down with the relass of decoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the incledition sequences given in the sequence listening from the present in the sequences are also called SEQ ID No.11 to 2815, and then the last sequences are also called SEQ ID No.1 to 185, but the sequences differ from the previously named sequences. SEQ ID No.11 to 1680 (AAA32323 to AAA3392) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention. N.B. The specification describes antisense oligonucleotides (AAX52869-X55271)
directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, gene initiation
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
end and the juxae-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX55272-74. These multiple target oligonucleotides
(specifically AAX55180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, respiratory
cutte asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
```

The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiniflammatory, antialergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treament of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphonas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONS reduces side effects. The A-containing ONS break down with the

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
coding regions of RNAs corresponding to target genes, gene initiation
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5572-74. These multiple target oligonucleotides
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5572-74. These multiple target oligonucleotides
conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
alters syndrome, pain, cystic fibrosis, pulmonary hypertension,
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, brast cancer, lung cancer, melanoma, hepatic metastasized
to the lungs, including breast and prostate cancer

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
end and the juxta-section between coding and non-coding regions and all
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
conditions or mixtures. The antisense oligonucleotides may be derived
conditions or mixtures. The antisense treatment of diseases and conditions are those
conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
cute asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
pulmonary vasoconstriction, emphysema, directive pulmonary
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, melanoma, hepatic metastases, as

The present invention describes a recombinant adeno-associated virus (AAV) vectored ribozyme composition (I). (I) comprises: (a) at least a first ribozyme that specifically cleaves an mRNA encoding a protein, compression of polypeptide, or peptide selected from the group of rod opsin, iNOS.

                                                                                                       A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the human IIG receptor. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the human li6 receptor. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchits and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treatment of airway diseases such as asthma - by topically applying adenosine-free antisense oligo:nucleotide to airway epithelium of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genemic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99999, ABF00010-ABF99999, ABH00010-ABH99999 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC09989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hairpin ribozyme; hammerhead ribozyme; ribozyme; retinal disease; target; ophthalmological; gene therapy; eye; retinal dysfunction; AAV; diabetic retinopathy; macular degeneration; autosomal dominant retinitis; blood-retinal barrier dysfunction; adeno-associated virus; blindness; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A recombinant adeno-associated virus-vectored ribozyme composition, useful for treating a disease or dysfunction of the mammalian eye e.g. retinal disease, e.g. diabetic retinopathy or age-related macular

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82071 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo int/pub/published_pct_sequences
                                                                                                                                                                                                                                                     SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                            Oligonucleotide SEQ ID NO 248814 for detecting SNP TSC0060796.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; SEQ ID NO 248814; 29pp + Sequence Listing; German.

                                                                                                                                                                ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for dececting cell type differentiation. ABC00010 ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI32073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010 -ABC99989, ABF0010-ABF9989, ABH0010-ABH99989 and ABI0010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but
                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC099889, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invantion. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at fitted specification, but fit.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 tepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form mat for the printed specification, but the wipo int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences

```

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99889, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at Gaps ; 42.7%; Score 9.4; DB 1; Length 13; 90.9%; Pred. This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting call type differentiation. ABC00010-ABE99999, ABF00010-ABF99999, ABH00010-ABH99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form at from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

             This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010 ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABH82073 targresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and merabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC099889, ABF00010-ABF99889, ABH00010-ABF99899 and ABI00010-ABF82073 represent the oligomers described in the invention. This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretracted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic discorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99889, ABC0010-ABF9989, ABH00010-ABH9989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic formmat from WIPO at this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 capeseen the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at
      designed to detect single-nucleotide polymorphisms and cytosine methylation status.

      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligoners for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligoners are also used for detecting cell type differentiation. ABC00101800018 ABC0010-ABF9989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format from WIPO at

```
acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073
